Definition: Exponential Function. An exponential growth or decay function is a function that grows or shrinks at a constant percent growth rate. The equation can be written in the form $f(x) = a(1+r)^x$ or $f(x) = ab^x$ where $(b = 1+r)$ and

4.1 EXPONENTS AND EXPONENTIAL FUNCTIONS

The general form of the exponential function is $f(x) = ab^x$, where a is any nonzero number, and b is a positive real number not equal to 1. The exponential function is unlike any we have studied thus far, and we will add it to our collection of Toolkit functions. If $b > 1$, the function grows at a rate proportional to its size.

An exponential function f with base b is defined by $f(x) = b^x$, where $b > 0$, $b \neq 1$, and x is any real number.

Note: Any transformation of $y = b^x$ is also an exponential function. Example 1: Determine which functions are exponential functions. For those that are not, explain why they are not exponential functions.

An exponential function

is a function of the form $f(x) = a^x$ where $a \neq 1$ is a positive constant. We call a the base. The graphs when $a < 1$ and $a > 1$ are different.

4.3 Logarithmic Functions We've dealt with exponential functions and we know that the graph of an exponential function of the form $f(x) = ax$ is one-to-one, which means it must have an inverse. The inverse of the exponential function $f(x) = ax$ is the logarithmic function with base a . $\log ax = y$, $ay = x$
In words, \log

Uncontrolled population growth, as in the wild rabbits in Australia, can be modeled with exponential functions. Equations resulting from those exponential functions can be solved to analyze and make predictions about exponential growth. In this section, we will learn techniques for solving exponential functions.
