learning is one of several plans to create data-efficient artificial intelligence systems. At this point, it's really hard to predict which technique will succeed in creating the next AI revolution (or if we'll end up adopting a totally different strategy). But here's what we know about LeCun's masterplan.

Self-supervised learning: The plan to

Weakly supervised learning are that you use priors. You use explicit and implicit priors about shape, size, and contrast.

Also, motion can be used, for example, to shift bounding boxes. The class distributions tell us that some classes are much more frequent than others.

While Computer Vision is making amazing progress on self-supervised learning only in the last few years, self-supervised learning has been a first-class citizen in NLP research for quite a while. Language Models have existed since the 90's even before the phrase "self-supervised learning" was termed.

Self-supervised learning VS transfer learning Transfer learning is a fair point to start. Transfer learning enables us to exploit the weights of a (convolutional) neural network used for task A and apply it to another task (B), given that the input domains are somehow related.
