## **CT scan vs. MRI scan: What are the differences?**

CT (computed tomography) and MRI (magnetic resonance imaging) are both used to diagnose and stage cancer. Many people do not know the difference between the two methods or why one might be selected over the other. Here, radiologist Richard Do answers some of the questions he gets from his patients about CT and MRI.

the two scanning devices work. The CT scan uses x-rays to scan the body and to capture pictures in the details. CT Scan exposes one to forms of radiation. The CT machines have become faster over time thus the patient is exposed to a lower level of radiation today.

### **Difference Between CT Scan and MRI of Brain - HRF**

CT and MRI both offer potential for a thorough evaluation of the aorta and precise aortic measurements using 3D datasets. For evaluation of the aortic root and ascending aorta, the best results are obtained with ECG gating. Cardiac pulsation and motion of the aortic root frequently make accurate measurements impossible otherwise.

A CT Scan (or CAT Scan) is best suited for viewing bone injuries, diagnosing lung and chest problems, and detecting cancers. An MRI is suited for examining soft tissue in ligament and tendon injuries, spinal cord injuries, brain tumors, etc. CT scans are widely used in emergency rooms because the scan takes fewer than 5 minutes.
