1. Introduction. The pipes have been extensively applied in various engineering fields used as common devices containing and conveying fluid , , .By absorbing the kinetic energy of the flowing fluid, the pipe often vibrates intensely due to the fluid-structure interaction (FSI), namely self-excited vibration, which is hazardous or potentially risky for mechanical structures.

The fluid-conveying pipes made of polymer-like materials are widely applied in engineering fields. However, the fractional dynamics of fluid–solid interaction remain unknown. In this work, the fractional dynamics of the pipes subjected to the excitation of supporting foundation are studied. A new nonlinear, fractional-order dynamic model is presented.
