Work is basically defined as the transformation of energy by any process except from heat in the field of thermal engineering. In thermal engineering energy transfer in the form of work will be calculated by the product of force (F) and displacement (X). Displacement will be in the direction of the force.

Despite that success, this disquisition refutes the energy conversion doctrine in favor of entropy-growth-potential-centric (EGP-centric) approach that is necessary for achieving efficiency rather than expediency. With the new theory of heat, this chapter outlines a philosophical prelude to engineering application of thermodynamics.

Heat transfer is an engineering discipline that concerns the generation, use, conversion, and exchange of heat (thermal energy) between physical systems. In power engineering it determines key parameters and materials of heat exchangers. Heat transfer is usually classified into various mechanisms, such as:

What is Thermodynamics and Heat Transfer - Definition

Heat is energy transferred as the result of a temperature difference. Neither heat nor work are thermodynamic properties of a system. Heat can be transferred into or out of a system and work can be done on or by a system, but a system cannot contain or store either heat or work.
