Timeline of Focused Ultrasound - Focused Ultrasound Foundation

While ultrasound is very common today, it hasn't been around for that long. In fact, it's less than a century old and didn't become commonplace until the 1960s. The first time ultrasound was used for clinical reasons was in 1956. It was used in Glasgow by an Obstetrician named Ian Donald and an engineer named Tom Brown. These two men developed the first prototype system for ultrasound ...

Who Invented Ultrasound? - CME Science

Ultrasound is a valuable tool, but it has limitations. Sound doesn't travel well through air or bone, so ultrasound isn't effective at imaging body parts that have gas in them or are hidden by bone, such

as the lungs or head. To view these areas, your doctor may order other imaging tests, ...

Ultrasound - Mayo Clinic

An ultrasound scan is a medical test that uses high-frequency sound waves to capture live images from the inside of your body. It's also known as sonography.

Ultrasound: Purpose, Procedure, and Preparation

Ultrasound has frequencies pitched above human hearing (above roughly 16 kHz). Scientists can make narrow beams of "silent" ultrasound far more intense than the roar of a jet engine, but completely unheard by our ears. Ultrasound has wavelengths between succession compression waves measuring roughly 10 cm to 10⁻³ centimeters.

Sonochemistry: The Suslick Research Group

Diagnostic ultrasound is a non-invasive diagnostic technique used to image inside the body. Ultrasound probes, called transducers, produce sound waves that have frequencies above the threshold of human hearing (above 20KHz), but most transducers in current use operate at much higher frequencies (in the megahertz (MHz) range).

Lung ultrasound is a bedside noninvasive method allowing immediate assessment of most disorders impairing the function of this vital organ. Although little used for decades, lung ultrasound provides standardized and reproducible information, using a simple small grayscale hybrid unit (such as the one we have used since 1992, but 1982 machines have also proved excellent for this task).

Lung Ultrasound in the Critically Ill - ScienceDirect

Ultrasound is sound waves with frequencies higher than the upper audible limit of human hearing. Ultrasound is not different from "normal" (audible) sound in its physical properties, except that humans cannot hear it. This limit varies from person to person and is approximately 20 kilohertz (20,000 hertz) in healthy young adults. Ultrasound devices operate with frequencies from 20 kHz up to ...
